Action-head text attention

Subtask supervision

[Task] Take the pen out of the cup and place it on the table. **[Subtask]** Grasp the pen in the cup.

Embodied CoT

[Task] Take the pen out of the cup and place it on the table. **[Plan]** Grasp the pen, lift it out of the cup, move it over the table, and release. **[Subtask]** Grasp the pen. **[Move]** Move down toward the pen.

[Objects] Green pen; white cup; paper notes.

💡 ARC: Action-grounded causal reasoning traces

[State] The robot sees the white cup at center-right with the green pen standing in its opening, white paper notes nearby, and the gripper positioned close around the pen. **[Cause]** The pen is still held by the cup, so it must be grasped securely before it can be pulled out and placed on the table. **[Effect]** The chosen effect is a stable, centered hold on the exposed shaft of the pen. **[Action]** This implies the robot should pinch the lower visible portion of the pen shaft with the gripper fingers, and lift only after a stable hold is confirmed.

[Avoid] The robot must not let the gripper contact the cup rim or wall, or knock the cup. **[Completion]** The task is incomplete, since the pen has not yet been removed from the cup and set on the table.
